# Installing the Remotely Client on Linux

## Install the client on Linux

Your clients, family, friends, or anyone you are doing remote support for, can go to your remotely server URL, then click on the Downloads tab.  Here they'll see a list of available downloadable clients for the various operating systems and architectures Remotely can support.

## Dependencies Needed.

You'll need a few files installed in order for the Remotely Client to function properly on Linux (only tested on Ubuntu 18.04 and later).

`sudo apt update`

`sudo apt install libx11-dev libxrandr-dev libc6-dev libgdiplus libxtst-dev xclip`

## Make Remotely Client Executable

`chmod +x Remotely_Desktop`

## Run the Remotely Client

`sudo ./Remotely_Desktop`
